ABSTRACT OF THE DISCLOSURE

A wireless base station which controls joining of a
plurality of wireless terminals to a wireless network,
5   stores a maximum joining possible terminal number which
indicates a maximum number of the wireless terminals of
each terminal type that can join the wireless network
simultaneously, and which is set in advance for each one of
a plurality of terminal types that classify the wireless
10 terminals, and a currently joining terminal number which
indicates a number of the wireless terminals of each
terminal type that are currently joining the wireless
network, for each one of the plurality of the terminal
types. Then, the wireless base station judges whether the
15 joining of one wireless terminal of one terminal type which
sent a request message to the wireless network is permitted
or not, according to the maximum joining possible terminal
number for the one terminal type and the currently joining
terminal number stored for the one terminal type.
